

BioCeres EC

Liquid Mycoinsecticide

BioCeres EC utilizes entomopathogenic fungus, *Beauveria bassiana*, to target select foliar feeding and soilborne insect pests. BioCeres EC offers the ideal biological control option for reducing insecticide resistance, while managing target pests.

ACTIVE INGREDIENT:

<i>Beauveria bassiana</i> strain ANT-03*	10.0%
OTHER INGREDIENTS	90.0%
TOTAL	100.0%

*Contains a minimum of 1×10^{10} viable conidia/mL of product.

INSECT PESTS CONTROLLED

Whiteflies, aphids, thrips, plant bugs, spotted lanternfly, and leaf-feeding insects

KEY FEATURES & BENEFITS

- Effective on all insect life stages
- No harmful residues, no known resistance
- Easy mixing and application
- 4-hour REI; zero-day PHI
- Tank-mix compatible with most commonly used pesticides, fertilizers, and adjuvants

MODE OF ACTION

When *B. bassiana* spores come into contact or are ingested by insect pests, they quickly germinate, penetrate the external skin (cuticle), and reproduce inside the body, killing the pest within 3–5 days. After death, the host becomes a vector for spore production adding further control to BioCeres EC applications.

HOW SHOULD BIOCERES EC BE USED?

BioCeres EC is an ideal product for integrated pest management programs. It effectively controls all life stages of many insect species and helps prevent or slow the development of insecticide resistance in pest populations. This biopesticide utilizes a fungus that grows naturally in soil and acts as an insect pathogen. BioCeres EC should be applied at the first sign of a pest infestation for best results. Newly hatched insects are most susceptible to infection by the *Beauveria bassiana* fungus. For optimal performance ensure thorough coverage.

Aphids killed by the *Beauveria bassiana* fungus often show white fungal growth of the entomopathogen.
